

A LITTLE BACKGROUND

The Goliath beetles (named after the biblical giant Goliath) are any of the six species in the genus Goliathus. Goliath beetles are among the largest insects on Earth, if measured in terms of size (4.5 inches), bulk and weight (4 ounces).

The bulky bodies of Goliath beetles are composed of a thick and hardened exoskeleton, which protects their organs and hindwings. Like most beetles, they possess reinforced forewings (called elytra) that act as protective covers for their hindwings and abdomen.

FAST FACT

Males have rounded heads with small, fork-shaped horns while females lack these horns and have a more wedge-shaped head!

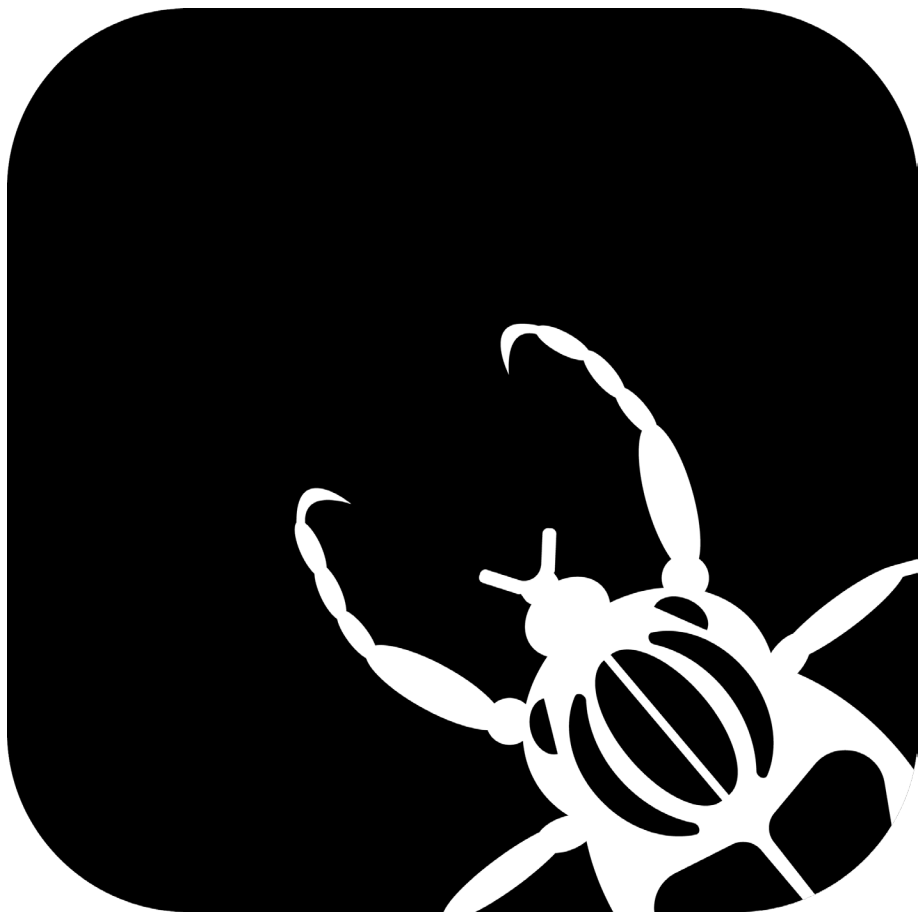

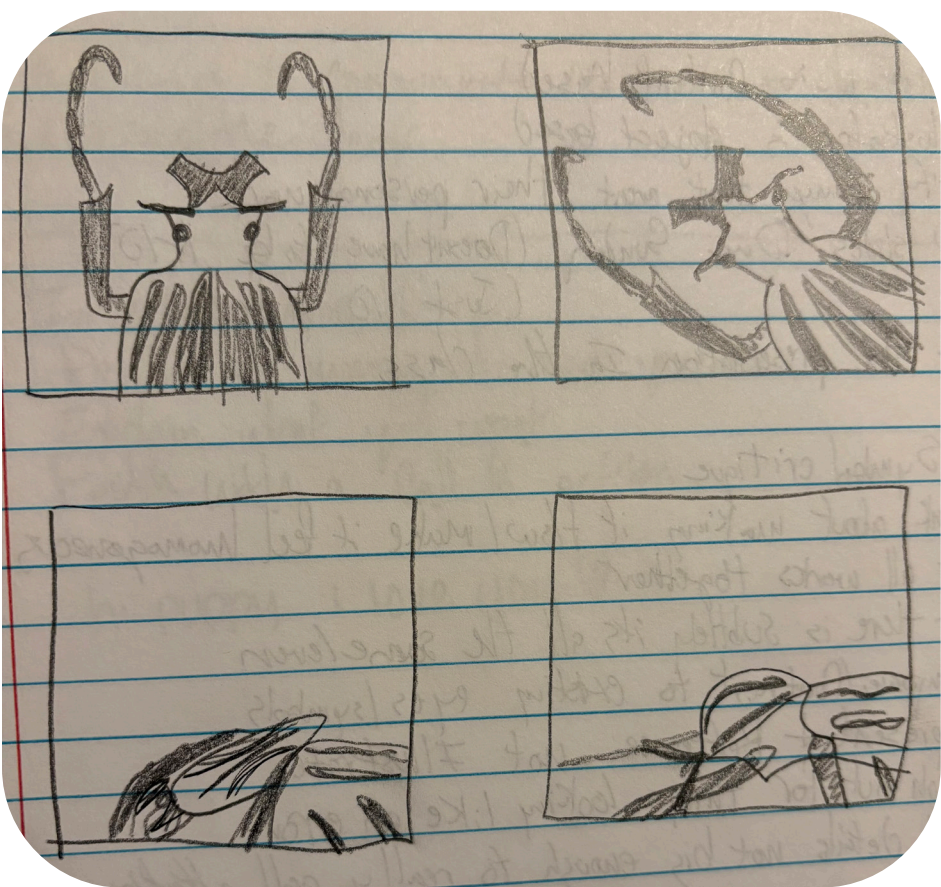

BIG #10% ING BUG

SYMBOL IN SYSTEM

THE SYMBOL PROCESS

Initially, I made the symbol much smaller and more detailed in the legs of the Goliath Beetle. This however contradicts the “spirit of the beetle.” It’s the biggest beetle out there, it needs to be HUGE! I also gave up some detail for easier readability from any distance. I think I found a perfect medium of detail and simplicity.

My symbol has more black than the others. I’d argue that it’s because of the creatures “spirit” come from their unique exoskeleton pattern.

I toyed with the idea of an angle from the side, but decided that over top was the best way to capture the “spirit of the beetle.”
